Measurements, Validity, Reliability

0.1 Grouping Practice

You can do double column grouping

Note. Can use .relabel to relabel tables

0.2 Row Operations

Arrays can only have one type. Will be cast into a certain variable.

New method **.row()** we pass in a index and returns a **datascience.tables.Row**. Also we have **table.with_row()** where we pass a LIST not an array since lists allow different data types.

0.3 Validity and Reliability

Reliability: how repeatable the measurement is

Validity: how well the measurement measures the concept
